To the Honourable the Legislative Assembly of the Province of British Columbia, in Legislature Assembled:

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

Matt Rossi	#68-19501 74th AVE. SURREY	

To the Honourable the Legislative Assembly of the Province of British Columbia, in Legislature Assembled:

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

Dated Monday day of February 16, 20 26.

Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

To the Honourable the Legislative Assembly of the Province of British Columbia, in Legislature Assembled:

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

Dated 13 day of Feb, 2026.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

Dated 11 day of Feb, 2026.

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

Dated 20 day of February, 2026.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

Dated 12 day of February, 2026.

To the Honourable the Legislative Assembly of the Province of British Columbia, in Legislature Assembled:

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

Lea Turner	46 - 19525 73 Ave Surrey	

To the Honourable the Legislative Assembly of the Province of British Columbia, in Legislature Assembled:

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

To the Honourable the Legislative Assembly of the Province of British Columbia, in Legislature Assembled:

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

Lindsey Shim	105-20020 84 Ave	

To the Honourable the Legislative Assembly of the Province of British Columbia, in Legislature Assembled:

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

1

To the Honourable the Legislative Assembly of the Province of British Columbia, in Legislature Assembled:

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.

Your petitioners respectfully request that the Honourable House:

1.The Willoughby Substation site should be reconsidered and built in a location away from dense residential communities.

2. Require BC Hydro adopt mitigation measures that meet urban development standards and align with best practices for substation located in residential neighbourhoods (underground or GIS less footprint enclosed) if the project proceeds as planned.

3. Require BC Hydro to complete and publicly release traffic and safety impact assessments for the proposed substation.

4. Ensure meaningful community consultation occurs prior to final site selection and construction of major electrical infrastructure.

5. Mandate coordination between BC Hydro and the City so that infrastructure projects do not compromise neighbourhood safety, school access and pedestrian mobility.

6. Ensure no devaluation of property values results from the location of the substation and that health of the community is a priority.

Dated 22 day of Feb., 20 26.

To the Honourable the Legislative Assembly of the Province of British Columbia, in Legislature Assembled:

The petition of the undersigned Residents of British Columbia states:

That BC Hydro is proposing the construction of a new electrical power substation within the Willoughby/Clayton Heights area of Surrey, British Columbia, a neighbourhood that has developed into a dense residential community.

That the below petitioners believe a planned Willoughby power substation undermines existing community development plans and reflects a lack of adequate planning and community engagement on the part of BC Hydro. Six Years ago this area was undeveloped. It should be the responsibility of BC Hydro to build necessary infrastructure before residential communities have grown beyond power capacities.

That the proposed substation is located in proximity to Maddaugh Elementary School, giving rise to concerns regarding public safety, particularly the safety of children accessing the school. Currently 194 is the only road with pedestrian access for Children to walk to school. One child has already been hit by a car on the walk to school.

That the City of Surrey has identified plans for future pedestrian and roadway improvements via a green space walkway and extension of 194a to support safe access to the school and that BC Hydro has stated that they will not honour these plans.

That BC hydro states that it will mitigate light and sound and keep substation integrated within residential community 'where possible'. This wording is insufficient. The phrase ' where possible ' creates an unacceptable level of ambiguity and does not guarantee meaning mitigation or accountability. Residents require clear, enforceable commitments.

That residents support the need for reliable electrical infrastructure but believe Power substations should not be built in dense residential neighbourhoods. Major infrastructure projects located near schools require enhanced planning, transparency, and coordination with municipal development and community safety considerations.
